SUMMARY

Platform Engineer focused on making production infrastructure faster, safer, and cheaper. Builds and modernizes AWS and Kubernetes platforms through GitOps, Terraform, delivery automation, observability, and cloud cost optimization. Applies human-reviewed AI workflows to infrastructure review and incident investigation without giving agents production write access.

EXPERIENCE

Platform Engineer | Chowly

Chicago, IL · Nov 2023 – Present

Restaurant technology platform integrating third-party delivery marketplaces with restaurant POS systems.

- Migrated 20 services from CI-driven Helm deployments to Argo CD on EKS, establishing GitOps delivery across 3 environments and cutting merge-to-production from 2–4 hours to under 30 minutes.
- Replaced SSH deployments for 8 services with immutable Packer AMIs and ASG refreshes, eliminating manual production deployments; ~30 minutes of per-host restarts and validation became an 8–10 minute automated roll.
- Established PR and pipeline controls across 35 repositories with GitHub Actions, infrastructure validation, and security checks, reducing failed production deployments from ~10% to under 3%.
- Cut AWS spend ~18% (~\$60–80K annually) through EC2 right-sizing, EBS cleanup, S3 lifecycle policies, and cost monitoring.
- Built a human-in-the-loop model for AI-assisted infrastructure review, giving agents read-only access to Terraform plans and operational signals while keeping apply, merge, secrets, IAM changes, and production writes behind human approval.

DevOps Engineer | Grubhub

Chicago, IL · Jul 2021 – Nov 2023

High-volume online ordering and delivery platform running production services on AWS and Kubernetes.

- Built reusable Terraform modules for VPC, IAM, RDS, and remote state, standardizing infrastructure across 10+ services and reducing environment setup from days to hours.
- Automated container delivery with Jenkins, Docker, Helm, and Kubernetes, replacing manual release steps with tested and repeatable CI/CD pipelines.
- Improved Kubernetes reliability by tuning resource requests, health checks, deployment strategies, and autoscaling behavior for services exposed to large swings in ordering traffic.
- Built Prometheus/Grafana dashboards and CloudWatch alarms for application latency, Kubernetes health, AWS infrastructure, and deployment failures, improving visibility during production incidents.
- Supported production on-call across AWS and Kubernetes, troubleshooting compute, networking, capacity, and deployment issues and automating recurring operational checks with Python and Bash.

SKILLS

Cloud & Systems: AWS (EKS, EC2, ECR, VPC, IAM, S3, RDS, Route 53, CloudWatch) · Linux · Networking · DNS · Load Balancing

Kubernetes: Kubernetes/EKS · Karpenter · HPA · Docker · Helm · RBAC · IRSA

Infrastructure & Delivery: Terraform · Argo CD · GitOps · GitHub Actions · Jenkins · CI/CD · Git

Observability & Reliability: Prometheus · Grafana · Thanos · CloudWatch · Alertmanager · Incident Response · On-Call

Security: AWS IAM · IRSA · Kubernetes RBAC · AWS Secrets Manager · Least-Privilege Access

AI-Assisted Engineering: Claude Code · MCP · Infrastructure Review · Incident Investigation · Human-in-the-Loop Validation

Automation: Python · Bash

CERTIFICATION

Certified Kubernetes Application Developer (CKAD) — The Linux Foundation / CNCF

Credential ID: LF-foco5c3jzm · credly.com/badges/6c6024f2-9ab8-4094-bf6f-02a3768f001b
