SUMMARY

Platform Engineer building AWS and EKS platforms for restaurant technology and high-volume ordering systems, focused on safer GitOps delivery, production reliability, and infrastructure automation.

EXPERIENCE

Platform Engineer | Chowly

Chicago, IL · Nov 2023 – Present

Restaurant technology platform integrating third-party delivery marketplaces with restaurant POS systems.

- Migrated 20 services from CI-driven Helm deployments to Argo CD on EKS, establishing GitOps across 3 environments and cutting approval-and-deployment lead time from 2–4 hours to under 30 minutes.
- Replaced SSH deployments for 8 services with immutable Packer AMIs and ASG refreshes, eliminating manual production deployments and cutting rollout time from ~30 minutes to 8–10 minutes.
- Established PR and pipeline controls across 35 repositories with GitHub Actions, Terraform validation, and security scanning, reducing failed production deployments from ~10% to under 3%.
- Implemented IRSA and least-privilege IAM across 20+ EKS workloads, replacing shared AWS access with per-service identities and retiring ~25 long-lived access keys.
- Cut AWS spend ~18% (~\$60–80K annually) through EC2 right-sizing, EBS cleanup, S3 lifecycle policies, and cost monitoring.
- Built AI-assisted Terraform review into CI across infrastructure pull requests, analyzing plans and diffs for IAM privilege expansion, network exposure, and destructive changes before merge, with read-only access and human approval required for production changes.

DevOps Engineer | Grubhub

Chicago, IL · Jul 2021 – Nov 2023

High-volume online ordering and delivery platform running production services on AWS and Kubernetes.

- Built reusable Terraform modules for VPC, IAM, RDS, and remote state, standardizing infrastructure across 10+ services and reducing environment setup from days to hours.
- Automated container delivery for 15+ services with Jenkins, Docker, Helm, and Kubernetes, replacing manual release steps and cutting typical release time from ~45–60 minutes to 15–20 minutes.
- Diagnosed a post-release CPU-throttling regression that degraded latency under load, restoring service by rollback, then tuning resource requests, limits, and HPA behavior and adding throttling alerts to surface similar regressions earlier.
- Built Prometheus/Grafana dashboards and CloudWatch alarms across application latency, Kubernetes health, and AWS infrastructure, helping on-call distinguish application failures from infrastructure issues during production incidents.
- Held the production on-call rotation for AWS and Kubernetes, tuning noisy alerts to reduce non-actionable pages and automating recurring operational checks with Python and Bash.

SKILLS

Cloud & Systems: AWS (EKS, EC2, ECR, VPC, IAM, S3, RDS, Route 53, CloudWatch) · Linux · Networking · DNS · Load Balancing

Kubernetes: Kubernetes/EKS · HPA · Docker · Helm · RBAC

Infrastructure & Delivery: Terraform · Argo CD · GitOps · GitHub Actions · Jenkins · CI/CD · Git

Observability & Reliability: Prometheus · Grafana · CloudWatch · Alertmanager · Incident Response · On-Call

Security: AWS IAM · IRSA · Kubernetes RBAC · AWS Secrets Manager · Least-Privilege Access

AI-Assisted Engineering: Claude Code · MCP · Infrastructure Review · Incident Investigation · Human-in-the-Loop Validation

Automation: Python · Bash

CERTIFICATION

Certified Kubernetes Application Developer (CKAD) — The Linux Foundation / CNCF

Credential ID: LF-foco5c3jzm · credly.com/badges/6c6024f2-9ab8-4094-bf6f-02a3768f001b
